Got Encryption?

As the remote workforce grows, VPN use is at an all-time high.

This encrypts your data in motion, but data at rest on local drives should be encrypted as well.

When disposing of hardware make sure to use software to properly lifecycle drives.

Cyber Hygiene

Today's Topic:

SAFEGUARDING DATA

A Zero Day attack occurs when an attacker breaches a network, or computing system before vulnerabilities can be patched. In the computing world there is no such thing as set it and forget it. Installing updates immediately after testing is necessary to the company's digital survival. One single vulnerability can expose an entire network.

How often does your company update and perform backups?

The second Tuesday of every month is known to Windows users as "Patch Tuesday". This is the day that Microsoft releases new update bundles, do not wait to install these! Checking for available updates for all other software and hardware should be part of your company's daily checklist.

A regular backup schedule can save the company from more than accidental deletions. A complete backup of data is a great tool used to fight Ransomware, as well as protecting your network from failed hardware or a corrupted file. Every business will have a different schedule depending on the criticality of data used. The cybersecurity professionals at eFence have your company covered.
